Sprint Family Locator

help

how It works

[How accurate is Sprint Family Locator?](#)

Sprint Family Locator uses a combination of different techniques to locate a phone. Some techniques result in better accuracy than others and the technique used depends on many factors. No matter what, when you request a location you will always get the best possible location fix given the conditions. Generally, when locating phones, Sprint Family Locator will produce location accuracies anywhere between a few yards and a few hundred yards.

Sometimes poor geographic conditions and limitations of specific phone models can result in inaccurate locations. Common conditions that yield poor location accuracies include:

- The phone that you are trying to locate is deep inside a building or car.
- The phone is surrounded by tall buildings, hills, canyons, or trees.
- The phone is near large reflective surfaces (lakes, ponds, etc).
- The phone is powered off.
- The phone's battery has run out.
- The phone is not in Sprint network coverage.

By design, some phones are better in providing accurate locations. For example, phones with external antennas will tend to yield better accuracies. For specific information on how to create optimal conditions with a specific phone, you should consult the phone's user manual.

If you are currently using Sprint Family Locator and experiencing poor accuracy, please report this using the [Sprint Family Locator Location Accuracy Report](#).
